---

Dear Commissioners,

Given that you've now seen Aarons Pass Rd, how is it even remotely possible to get these structures down that section of road without turning it into a barren, annihilated, treeless dirt super highway? No other wind farm in the State has needed to clear such an extreme amount of vegetation, it completely contradicts what the project is trying to achieve. You only have to google wind turbine transport and look at the pictures to see that nearly every photo doesn't contain a single tree! The bends on the road alone are enough to navigate, they'll need to be completely wiped out and straightened. I find it hard to fathom that this is even being considered, how is this possibly thought of as a "green" project? Make no mistake the entire 20ks of road will need to be completely wiped out, it's obvious to even the average person what will be required to transport this size blade down APR, to allow this to happen would be a National disgrace!

Regards

Chontelle Rowland-Jones

This blade is 63 m long . Crudine Ridge blade is 67 long!!!!
